1. Overview

Humanoid Basics is an easy to setup Third Person Controller for humanoids with the basics features like:

- Basic Locomotion. Walk, Run Crouch, Jump, Climb etc.
- Switch aim direction.
- Automatic lean while aiming.
- Ik based weapon control, easy to add more.
- Multiple Animators including Civilian, Ninja, Zombie & Drunk.
- Basic Npc Support. Uses same Humanoid Core base script.

Getting Started

Let's add some game object tags to your project:

Go to **Edit > Project Settings > Tags and Layers** and then add a couple tags called "**Climbable**" and "**Weapon**". Then add a new Layer called "**Humanoid**". Make sure your Player has the Layer set to Humanoid as well as the Animator.

Note: You probably don't need to do this, as the package import all the Project Settings, but make sure if the mentioned tags exists.

Default Controls

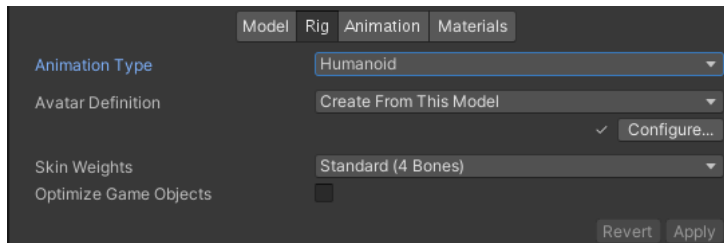

MOVE	W A S D
RUN	LEFT SHIFT
CROUCH	C
JUMP	SPACE
CLIMB	SPACE
SHOOT	LEFT CLICK
AIM	RIGHT CLICK
SWITCH AIM SIDE	T
RELOAD WEAPON	R

2. Humanoid Setup

Setting up your Humanoid could not be easier. We will break it into sections below.

Core Setup

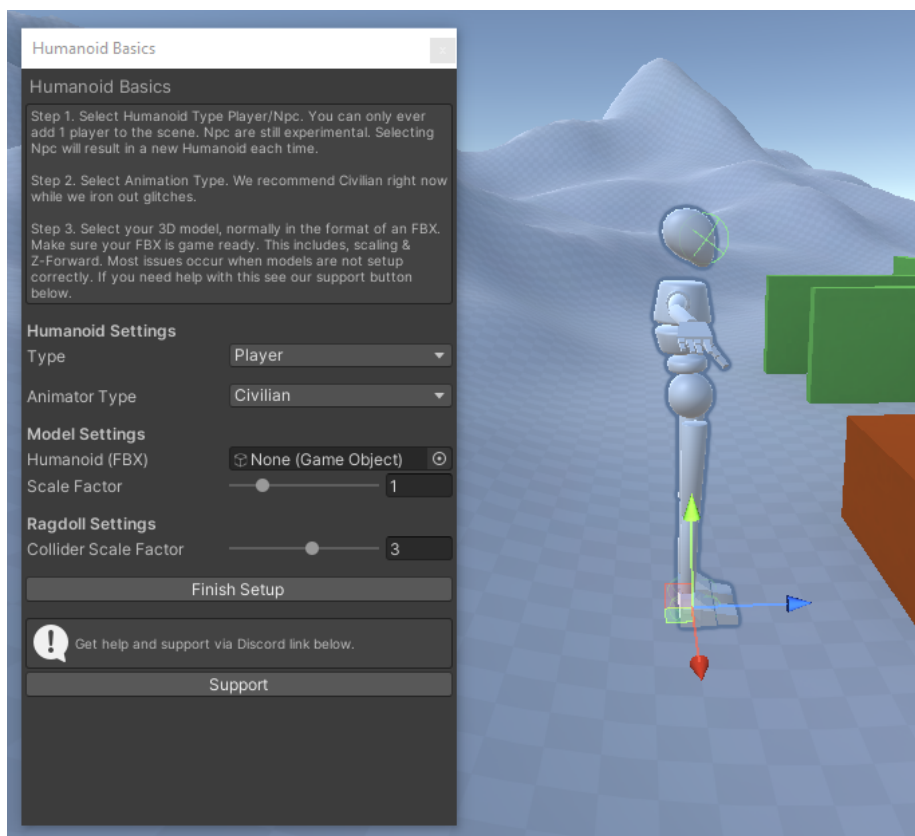

Make sure your FBX model is a Humanoid & Game Ready. When we talk about game ready we mean the model's scaling must be correct and all models Unity based have to be Z-Forward.

(Caption – Make sure Animation Type is set to Humanoid.)

Creating Player/Npc

In the top menu go to **Humanoid Basics > Player Setup**. This will bring up the Humanoid Basics Setup window.

(Caption – It will automatically instantiate a Player if there isn't one in the scene)

Options

Type

Player or Npc

Animator

Based Animator for the Humanoid, this can be Civilian, Ninja, Zombie, Drunk or Custom.

Model

The model asset you want to use as your Humanoid. This can be a prefab.

Scale Factor

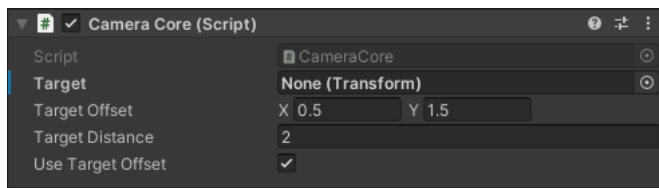

Adjust the Scale Factor so the Model fits in the Capsule Collider.

Collider Scale Factor

The scale collider factor on the model.

3. Camera Setup

To add a new camera to the scene simple click **ZForward > Humanoid Basics > Add Camera**.

Options

Target

Transform the Camera will focus on. Will automatically get set to player using the **Humanoid Setup**.

Target Offset

Offset Position from Target.

Target Distance

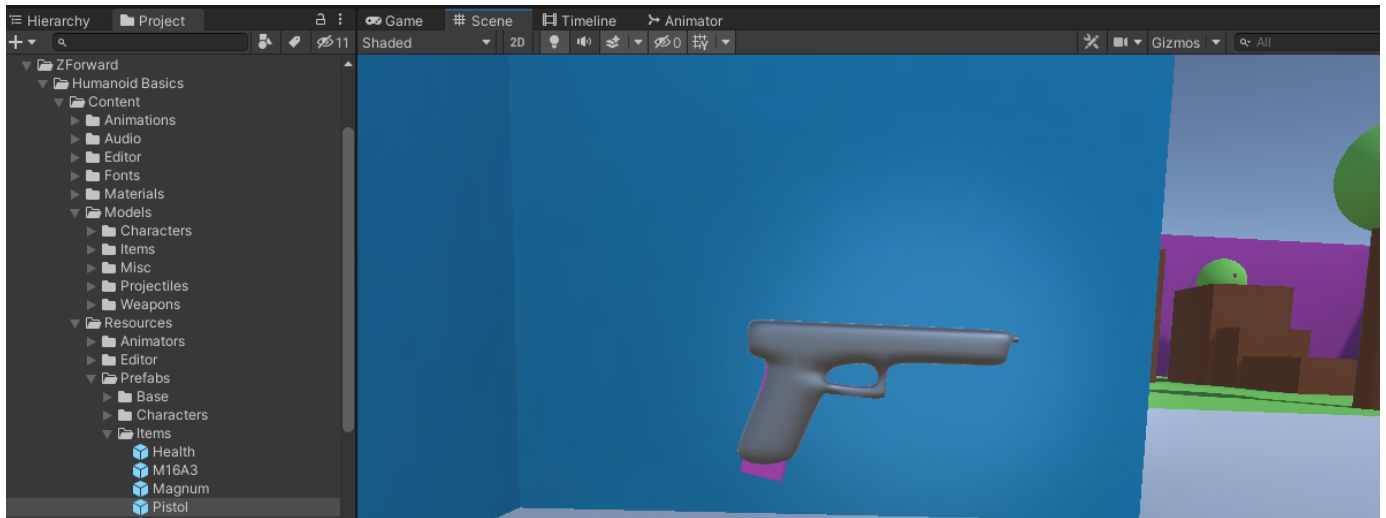

Distance from Target.

Use Target Offset

Toggle the usage of the offset. Use for switching Targets from another script that have a different offset.

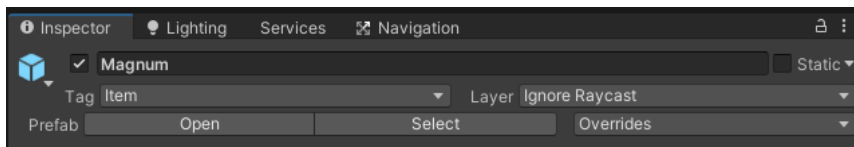

4. Adding New Weapons

Your new weapons will be based on the existing ones. So, if you want to add a new Pistol, go to **Resources > Weapons**, find the Pistol, drag and drop to the scene to edit:

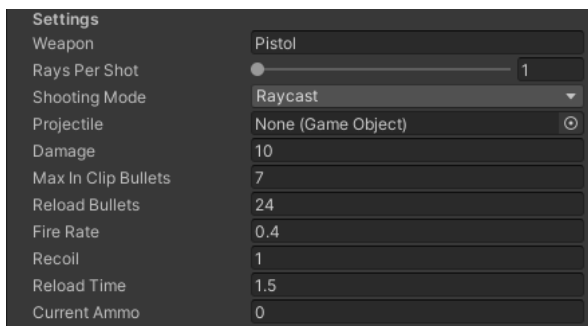

Creating a new prefab

First, rename the game object to what you want to make, in my case, i want a "1911".

Editing the weapon settings

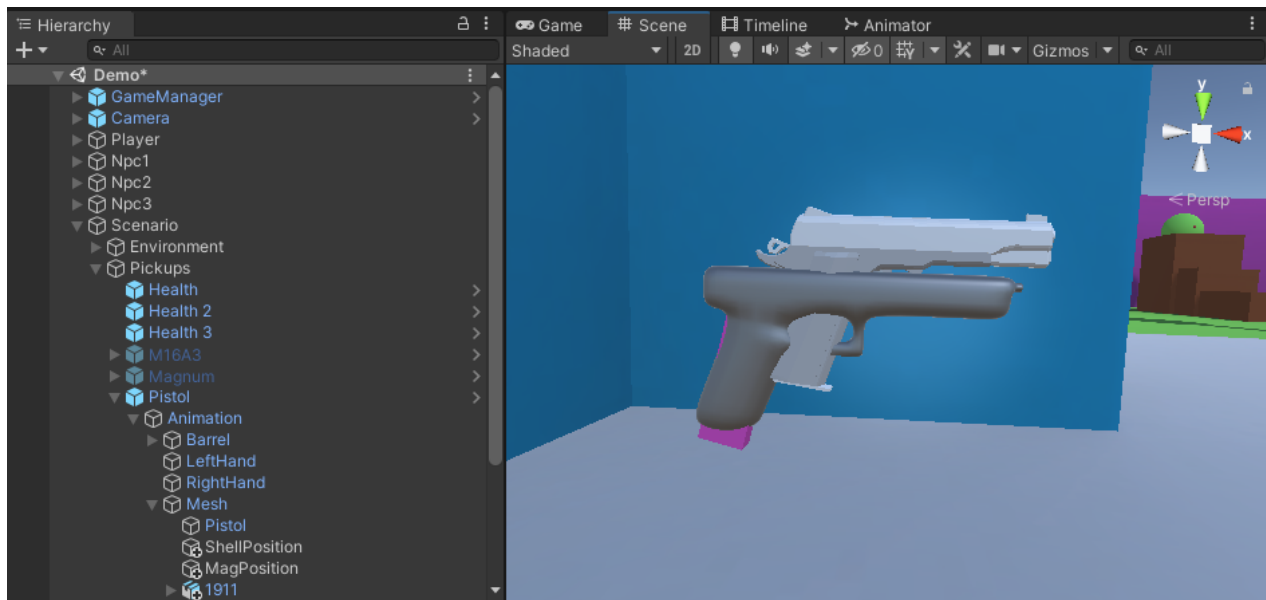

With your new weapon selected, check the Weapon Base in the inspector. As my weapon is based in a pistol, i need to change the name of it in the Settings

Changing the 3D model

For better organization create a folder called "3D" just for the new model. Go to your scene and open the **hierarchy** of your weapon like this (**weapon_name*/Animation/Mesh*).

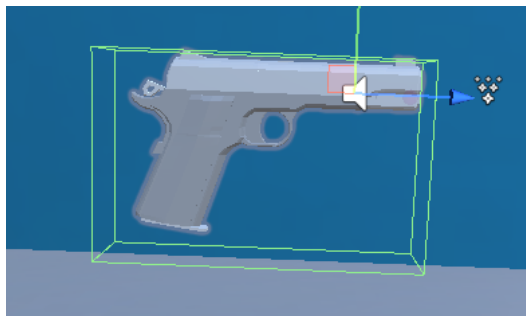

Drag and drop the new weapon FBX into the **Mesh** and **align** them:

Now you can delete the old model.

Adjusting the Box Collider

Every weapon needs a proportional collider for them, so, as i based my 1911 on a base pistol, i need to adjust the Box Collider. Make sure the **Box Collider** completely surrounds your **Mesh**:

5. Handling Shot Hits

Basically, when a weapon that uses Raycast (Pistol, Rifle, SMG) hits some collider, this function in the "WeaponBase" (located at Resources/Scripts/Weapon) called, you can do your stuff in it:

```
private void HandleHit(RaycastHit h)
{
    // Your Custom Code

    // Hitting an NPC
    if (h.transform.CompareTag("Npc"))
    {
        var parent = h.transform.root;
        var humanoidNpc = parent.GetComponent();
        if (!humanoidNpc) return;
        var humanoidNpcHealth = parent.GetComponent();
        if (humanoidNpcHealth)
            humanoidNpcHealth.Damage(damage);
    }
    else
    {
        ShotVisuals(h);
    }
}
```
